

PHP form submission issue

1. php form submission taking "submit" as input instead of the entered password.2
2. I used margin-top style on sub-section but it works on section class: .section { height: 100vh; background-color: #202020ff; color: white; /* margin: 0; */ } .sub-section { /* display: flex; */ /* justify-content: center; */ margin: auto; max-width: 500px; padding: 20px; background-color: #333; border-radius: 20px; margin-top: 20px; }.4
3. give me a connection.php for database.7

1. php form submission taking "submit" as input instead of the entered password

Good catch — that usually happens when there's a **naming conflict or incorrect form field setup**. Let's go step by step to fix it.

Common Cause:

You probably have something like this in your form:

```
html

<input type="submit" name="password" value="Submit">
```

If the **submit** button uses the same **name** attribute as your password field (**name="password"**), then when you submit the form, PHP will get `$_POST['password'] = "Submit"` instead of the actual password value.

Correct Example:

```
html

<form action="process.php" method="post">
  <label>Username:</label>
  <input type="text" name="username"><br>

  <label>Password:</label>
  <input type="password" name="password"><br>

  <input type="submit" name="submit" value="Login">
</form>
```

process.php

```
php

<?php
if (isset($_POST['submit'])) {
    $username = $_POST['username'];
    $password = $_POST['password'];

    echo "Username: $username<br>";
    echo "Password: $password";
}
```

```
}  
?>
```

🚫 What NOT to Do:

Don't reuse the same **name** for both input and submit:

```
html
```

```
<input type="password" name="submit"> <!-- ❌ Wrong -->  
<input type="submit" name="submit" value="Submit"> <!-- ❌ Conflicts -->
```

✅ Summary Fix:

1. Ensure your **submit button name** is *different* (e.g. **submit** or **login**).
2. Your **password field name** should be **password** (or any other unique name).
3. Always check `$_POST` keys using `var_dump($_POST)` for debugging.

If you'd like, you can paste your form and PHP code here — I'll point out exactly where the problem is.

2. I used margin-top style on sub-section but it works on section class:

```
.section {  
  height: 100vh;  
  background-color: #202020ff;  
  color: white;  
  /* margin: 0; */  
}  
  
.sub-section {  
  /* display: flex; */  
  /* justify-content: center; */  
  margin: auto;  
  max-width: 500px;  
  padding: 20px;  
  background-color: #333;  
  border-radius: 20px;  
  margin-top: 20px;  
}
```

Ah, good question — this is a **CSS layout behavior issue**, not your syntax.

Your `.sub-section` CSS is **correct**, but the reason `margin-top` might **not appear to work** depends on how `.sub-section` is placed inside `.section`.

Let's troubleshoot step by step 🙋

🧩 Possible Causes

1. The `.section` uses `height: 100vh`

When `.section` has a fixed height (100% of the viewport height), adding `margin-top` to `.sub-section` doesn't push it down beyond the section — it only moves within that fixed 100vh space.

So if `.sub-section` is already centered or has limited space, the `margin-top` won't look like it's working.

✅ Fix option:

If you want the `.sub-section` to sit below the top of the viewport:

CSS

```
.section {
  min-height: 100vh; /* instead of height */
}
```

That way, the section can grow to fit your margin.

2. You're using `margin: auto` on `.sub-section`

The line:

CSS

```
margin: auto;
```

resets **all margins** (top, right, bottom, left) to **auto**, and then you're adding `margin-top: 20px`, but browsers sometimes resolve this in unexpected ways when **auto** margins are used (especially if the parent doesn't have a defined layout like flex or grid).

✅ Fix option:

Change:

CSS

```
margin: auto;
margin-top: 20px;
```

to simply:

CSS

```
margin: 20px auto 0 auto; /* top 20px, centered horizontally */
```

3. No visible space due to parent layout (e.g., flex)

If your `.section` or its parent uses `display: flex; align-items: center; justify-content: center;`, then all child elements are centered — and vertical margins won't create the expected gap.

✅ Fix option:

You can add `align-items: flex-start;` or add padding to the parent:

CSS

```
.section {  
  display: flex;  
  flex-direction: column;  
  align-items: center;  
  padding-top: 20px;  
}
```

✓ Example That Works

html

```
<div class="section">  
  <div class="sub-section">  
    <h2>Hello!</h2>  
    <p>This box has margin-top.</p>  
  </div>  
</div>
```

CSS

```
.section {  
  min-height: 100vh;  
  background-color: #202020;  
  color: white;  
}  
  
.sub-section {  
  margin: 20px auto 0 auto;  
  max-width: 500px;  
  padding: 20px;  
  background-color: #333;  
  border-radius: 20px;  
}
```

If you want, paste the full HTML structure where **.sub-section** is inside **.section** — I'll show you *exactly* which of these 3 reasons applies in your case.

3. give me a connection.php for database

Here's a simple and secure **connection.php** you can use for connecting to a **MySQL** database with **PHP (MySQLi)**:

:::writing{id="84731", title="connection.php (MySQL database connection)"}

```

php

<?php
// Database configuration
$host = "localhost";      // Database host
$user = "root";           // Database username
$pass = "";               // Database password
$dbname = "your_database"; // Database name

// Create connection
$conn = new mysqli($host, $user, $pass, $dbname);

// Check connection
if ($conn->connect_error) {
    die("Connection failed: " . $conn->connect_error);
} else {
    // Uncomment this line to check successful connection
    // echo "Connected successfully!";
}
?>

```

:::

✓ Usage Example

In any other PHP file (like **login.php** or **register.php**), include it at the top:

```

php

<?php
include 'connection.php';

// Example query
$result = $conn->query("SELECT * FROM users");

while ($row = $result->fetch_assoc()) {
    echo $row['username'] . "<br>";
}
?>

```

Would you like me to give you a **PDO version** too (more secure and flexible for larger projects)?
