

Process of finding the minimum element in an array:

We assume that the first element is the minimum, then for each element, if it's smaller than min, element becomes the new min

Process of finding the next point to insert on the hull:

We assume that the first point is the next point of the hull, then for each point, if $\text{orientation}(\text{on_hull}, \text{next}, \text{point})$ is counterclockwise, point becomes the new next
