

# Java User Input (Scanner)

[< Previous](#)[Next >](#)

## Java User Input

The `Scanner` class is used to get user input, and it is found in the `java.util` package.

To use the `Scanner` class, create an object of the class and use any of the available methods found in the `Scanner` class documentation. In our example, we will use the `nextLine()` method, which is used to read Strings:

### Example

[Get your own Java Server](#)

```
import java.util.Scanner; // Import the Scanner class

class Main {
    public static void main(String[] args) {
        Scanner myObj = new Scanner(System.in); // Create a Scanner object
        System.out.println("Enter username");

        String userName = myObj.nextLine(); // Read user input
        System.out.println("Username is: " + userName); // Output user input
    }
}
```

[Run Example »](#)

If you don't know what a package is, read our [Java Packages Tutorial](#).

# Input Types

In the example above, we used the `nextLine()` method, which is used to read Strings. To read other types, look at the table below:

| Method                     | Description                                      |
|----------------------------|--------------------------------------------------|
| <code>nextBoolean()</code> | Reads a <code>boolean</code> value from the user |
| <code>nextByte()</code>    | Reads a <code>byte</code> value from the user    |
| <code>nextDouble()</code>  | Reads a <code>double</code> value from the user  |
| <code>nextFloat()</code>   | Reads a <code>float</code> value from the user   |
| <code>nextInt()</code>     | Reads a <code>int</code> value from the user     |
| <code>nextLine()</code>    | Reads a <code>String</code> value from the user  |
| <code>nextLong()</code>    | Reads a <code>long</code> value from the user    |
| <code>nextShort()</code>   | Reads a <code>short</code> value from the user   |

In the example below, we use different methods to read data of various types:

## Example

```
import java.util.Scanner;

class Main {
    public static void main(String[] args) {
        Scanner myObj = new Scanner(System.in);

        System.out.println("Enter name, age and salary:");

        // String input
        String name = myObj.nextLine();

        // Numerical input
        int age = myObj.nextInt();
        double salary = myObj.nextDouble();

        // Output input by user
```

```
System.out.println("Name: " + name);
System.out.println("Age: " + age);
System.out.println("Salary: " + salary);
}
}
```

[Run Example »](#)

**Note:** If you enter wrong input (e.g. text in a numerical input), you will get an exception/error message (like "InputMismatchException").

You can read more about exceptions and how to handle errors in the [Exceptions chapter](#).

## Complete Scanner Reference

**Tip:** For a complete reference of Scanner methods, go to our [Java Scanner Reference](#).

### Exercise <sup>?</sup>

What is a correct syntax to create a Scanner object?

- ☐ Class Scan = new Scanner(System.in);
- ☐ Scanner myObj = new Scanner(System.in);
- ☐ Main myObj = new Main(Scanner);
- ☐ Scan myObj = new Scan(Scanner);
