

Java Arrays Class

[< Previous](#)[Next >](#)

The Java `Arrays` class (found in `java.util`), has methods that allow you to manipulate arrays.

Arrays Methods

A list of popular methods of the Arrays Class can be found in the table below:

Method	Description
<code>compare()</code>	Compares two arrays
<code>copyOf()</code>	Creates a copy of an array with a new length
<code>deepEquals()</code>	Compares two multidimensional arrays to check whether they are deeply equal to each other
<code>equals()</code>	Checks if two arrays are equal
<code>fill()</code>	Fills an array with a specified value
<code>mismatch()</code>	Returns the index position of the first mismatch/conflict between two arrays
<code>sort()</code>	Sorts an array in ascending order

Properties

Property	Description
<code>length</code>	Returns the length of an array

The `length` property is a built-in Java property, and does not belong to the Arrays class.
